Self-priming centrifugal pumps

J Series and ST-R series

The self-priming centrifugal pumps of the series **J** and **ST-R Varisco** are designed and manufactured to guarantee **high performance** and **ease of use** in multiple **industrial, purification and waste fluid management** sectors in general.

Active since 1932, Varisco boasts a long and consolidated experience in the design and production of pumps for use in industrial processes. All products are characterised by their reliability and quality and are tested at the internal Research and development centre.

Self-priming the operating principle of the J and ST-R series

The air (yellow flow) is drawn into the pump by the vacuum created by the moving impeller, and it emulsifies with the liquid (blue) in the pump body. The air-liquid emulsion is forced into the priming chamber where the lighter air separates and comes out from the delivery pipe; the heavier liquid falls back and recirculates. Once all the air is expelled from the suction duct, the pump is activated and runs just like a regular centrifugal pump. The pump can also run with an air-liquid mixture. The non-return valve has a dual function: it prevents the suction pipe from emptying when the pump is not running; if the suction pipe is accidentally emptied, it keeps sufficient liquid in the pump body for priming. The delivery pipe must be free to release the air deriving from the suction.

Applications

Water purification and treatment plants; landfills, power plants, smoke abatement and washdown.

Industry: industries manufacturing painting machinery, feed industry, industries for the processing, treatment and recovery of plastic, solvent-paint-additive-glue industries, automotive industries, steel plants, tanneries, paper factories; mechanical processing industries; protection of sites subject to floods; oil mills.

Chemical and petrochemical industries.

Food industries: wine industry (washdown), canning industries

Naval and shipboard platforms for bilge-ballast-fire prevention-washdown services.

OEM: Vehicle transformation industries (concrete mixers, sprayers, road washing, water distribution); vehicle wheel wash plants.

Agriculture for irrigation and management of waste water, fertilisers; aquaculture facilities; animal farm slurry.

J Series

Main characteristics of the range

The J self-priming centrifugal pumps are used in applications requiring a fast priming capacity from demanding suction heights combined with the ability to transfer and manage polluted, waste and abrasive fluids with suspended solids.

The system features an inspectable pump casing, which also acts as a water tank allowing for early quick priming without auxiliary systems, simplifying system management and reducing maintenance times.

Within the limits of physically permissible suction heights, J pumps offer a more convenient and reliable solution compared to submersible pumps and vertical shaft pumps with submerged impellers.

SOLIDS

TECHNICAL DATA

Solid passage up to 76mm

Maximum head up to 110m

Maximum flow rate up to 1200 m³/h

Inlets up to 300mm

Self-priming capacity
without auxiliary systems up to a 7.5m

Materials: cast iron, hardened cast iron, stainless
steel

SHAFT

MECHANICAL SEAL

CASING

- > **Top and dry installation** to ensure easier control, maintenance and management compared to submerged or vertical shaft solutions with submerged impeller
- > Suitable for handling **challenging fluids** and heavy-duty applications
- > Castings in **different metallurgy** with high thickness for resistance to abrasive and corrosive liquids
- > Casing with **inspection and drainage** covers for filling, washing and unclogging
- > **Semi-open impeller** in different metallurgy with the passage of solids from 11 to 76 mm
- > Easily replaceable **parts subject to wear** to restore original performance
- > **Mechanical seals** with counter faces in materials selectable based on use, suitable for containing abrasion and chemical aggression
- > Management of fluids with viscosity up to 50mm²/s (cSt) with standard sizing. Option of special sizing for dense and waste mixtures and slurries

OPTIONAL

- > inverter
- > flange kit
- > automatic greaser
- > cutting device
- > zinc anodes

Series ST-R

Main characteristics of the range

The ST-R self-priming centrifugal pumps are designed to facilitate unclogging operations in the field and ensure easy maintenance and high levels of reliability.

The front inspection cover can be used to access all internal parts without disconnecting the pipes and without removing the pump from the installation.

- > **Removable front cover** allows washing, unclogging in the field and routine maintenance operations without disconnecting the pipes and removing the pump from the installation.
- > **Semi-open impeller** made from casting, with two high thick vanes, with the passage of solids from 38 to 76 mm.
- > **Rotating unit** fully removable from the rear; if a spacer coupling is fitted, the operation can be performed without disassembling the motor, pump, and pipes.
- > **Clapet valve** easily replaceable through the inspection cover without disconnecting the pipes.
- > **Front and rear wear plates** rubber lined to protect the impeller vanes from abrasion.
- > **Front wear plate** easily adjustable from the outside (via adjusting screws) to restore original performance
- > **Mechanical seal** self-aligning in tungsten carbide with elastomers in Viton®
- > Mechanical seal and bearings placed inside **separate and independent oil chambers**, with level check visual indicators, to ensure greater reliability in case of dry running
- > **Upper cover and lower drain plug** to allow filling, emptying, and washing of the pump casing
- > **Relief valve** to protect the pump and system from incorrect operations

OPTIONAL

- > flange kit
